# Strategic Reporting and Dashboard Proposal

## Part 1: AI Prompt for Weekly Project Status Report

Act as a project management assistant responsible for generating a professional weekly status report for stakeholders.

Create a weekly project status report for the project **"Development of a Mobile Task Management Application."**

Project Details:

- Project Objective: Develop and launch a mobile application that helps users organize tasks, set reminders, and track productivity.
- Project Start Date: 1 March 2026
- Expected Completion Date: 30 June 2026
- Project Team: Product Manager, 3 Software Developers, UI/UX Designer, QA Tester.

Use the following information to generate the report:

- Tasks completed this week: Completed UI wireframes, set up backend database, and implemented login authentication module.
- Tasks currently in progress: Developing task creation feature, integrating notification system, and designing dashboard interface.
- Upcoming milestones: Beta version release scheduled for 20 April 2026.
- Risks or issues identified: Minor delay in backend integration due to API configuration issues.
- Budget or schedule updates: Project remains within the allocated budget but backend work is slightly behind schedule.

The report should include the following sections:

1. Executive Summary
2. Key Achievements This Week
3. Current Work in Progress
4. Upcoming Tasks and Milestones
5. Risks and Mitigation Strategies
6. Overall Project Health (schedule, budget, scope)

The report should be written in a professional tone suitable for senior management and project stakeholders.

---

# Part 2: Justification for Human Edits

Although generative AI tools can produce an efficient first draft of a weekly project report, human review is essential to ensure accuracy and reliability. AI models may occasionally generate incorrect assumptions or hallucinated information, making it necessary to verify all details against actual project data. As a project manager, I would carefully review the AI-generated content to correct inaccuracies, confirm key metrics, and ensure that the report accurately reflects the current project status. Human edits also allow the inclusion of strategic insights and contextual information, such as stakeholder priorities, team challenges, and organizational constraints that AI may not fully capture. Additionally, reviewing the report helps ensure that communication remains clear, ethical, and aligned with the project's objectives. Therefore, human oversight plays a critical role in maintaining the credibility, transparency, and strategic value of project reporting.

---

# Part 3: Strategic Dashboard Proposal

## Dashboard Metrics

The dashboard will include the following key project performance indicators:

- Overall Project Progress (%)
- Tasks Completed vs Pending
- Budget Utilization
- Active Risks and Issues
- Upcoming Milestones
- Team Productivity Metrics

## Filters for Stakeholders

To make the dashboard interactive and useful for different stakeholders, the following filters will be included:

- Project Team / Department
- Sprint or Week
- Project Phase
- Task Status (Completed, In Progress, Delayed)

## Dashboard Layout

### Top Section – Project Overview

- Project completion percentage
- Budget status indicator
- Schedule status indicator

**Middle Section – Performance Charts**

- Bar chart showing completed vs pending tasks
- Line chart showing weekly progress trend

**Bottom Section – Risk and Issue Tracker**

- List of active risks
- Risk severity indicators
- Mitigation status updates

## Rationale

The selected metrics focus on project progress, task completion, budget monitoring, and risk management, which are the most important aspects stakeholders need to evaluate project performance. Interactive filters allow project leads to analyze data based on teams, phases, or time periods, improving decision-making flexibility. Visual charts simplify complex project data and highlight trends that might otherwise be difficult to identify in written reports. This design ensures stakeholders can quickly understand the project's health and progress.

## Decision-Making Benefit

By presenting project data through clear visualizations and interactive filters, the dashboard enables leadership to quickly identify delays, monitor risks, and make faster, data-driven decisions.
